Machine Learning Lecture 4: SVM, PCA

Iurii Efimov

girafe ai

Outline

1. Support Vector Machine (SVM)
2. Dimensionality reduction and PCA
3. Validation strategies

Support Vector Machine

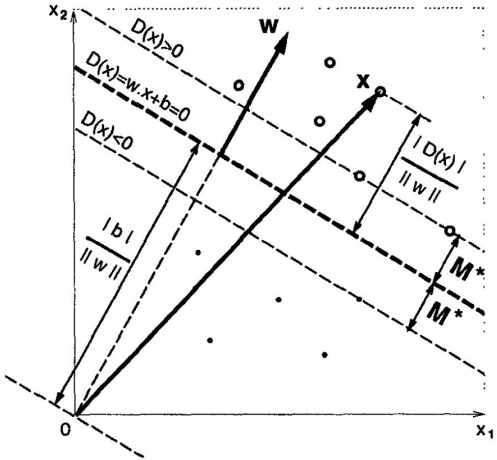
girafe
ai

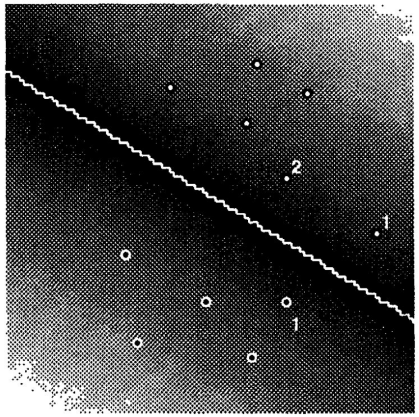
01

Support Vector Machine

1. History
2. Motivation
3. Solution for separable design
4. Inseparable design, soft margin
5. Kernels
    a. Kernel definition (Hilbert spaces, inner product, positive semidefiniteness)
    b. Kernels properties (addition, infinite sums)
    c. Types of kernels (poly, exponential, gaussian)
6. Current state

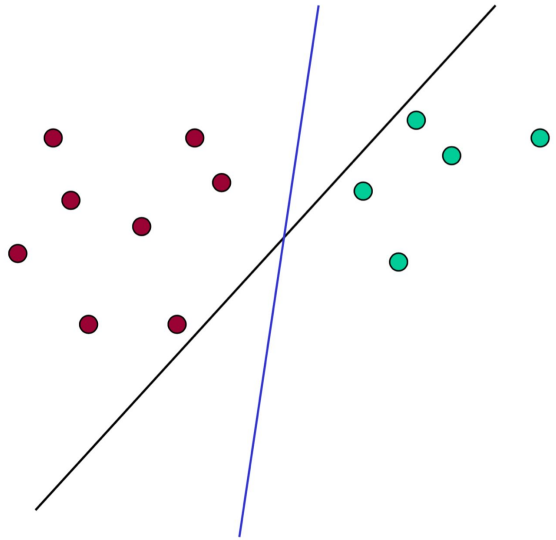
History





1963: SVM introduced by Soviet mathematicians Vladimir Vapnik and Alexey Chervonenkis
1992: kernel trick (Vapnik, Boser, Guyon)
1995: soft margin (Vapnik, Cortes)

Motivation



Linear separable case

Many separating hyperplanes exist

Maximize width

Margin

$$y \in \{1, -1\}$$

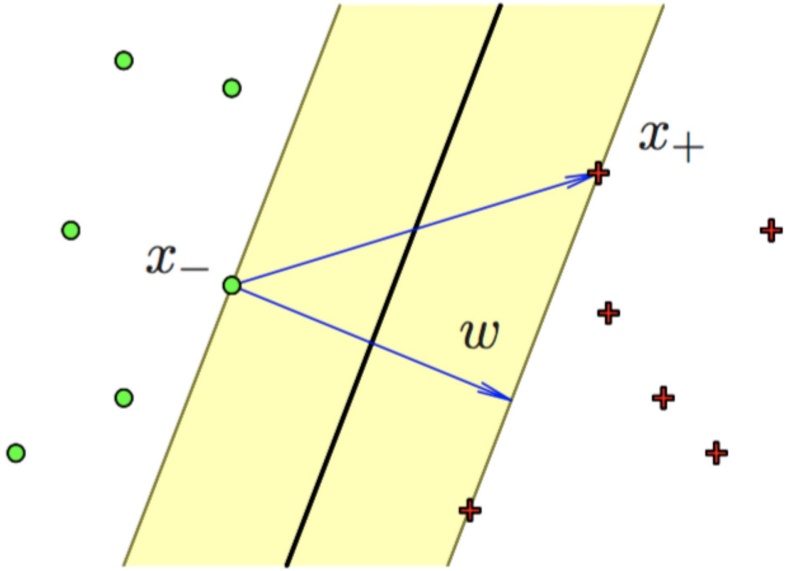
$$y_i = 1 : w^T x_i - c > 0$$

$$y_i = -1 : w^T x_i - c < 0$$

$$c_+(w) = \min_{y_i=1}(w^T x_i)$$

$$c_-(w) = \max_{y_i=-1}(w^T x_i)$$

$$\rho(w) = \frac{c_+(w) - c_-(w)}{2}$$



$$\rho\left(\frac{w_0}{||w_0||}\right) = \frac{1}{||w_0||}$$

Optimization problem

$$y_i = 1 : w^T x_i - c > 0$$
$$y_i = -1 : w^T x_i - c < 0$$
$$M_i = y_i \cdot (w^T x_i - c)$$

$$\rho(w) = \frac{1}{||w||} \to \max_{w,c}$$
$$s.t.\ y_i(w^T x_i - c) \geq 1$$

Convex problem!

$$L(w, c, \alpha) = \frac{1}{2} w^T w - \sum_i \alpha_i (y_i (w^T x_i - c) - 1)$$

Many of them are zeros

Hinge loss

$$L(w, c, \alpha) = \frac{1}{2} w^T w - \sum_i \alpha_i (y_i (w^T x_i - c) - 1)$$

$$L^{\text{hinge}} = (1 - M)_+$$

$$L(w, c, \alpha) = \frac{1}{2} ||w||_2^2 + \sum_i \alpha_i L_i^{\text{hinge}}$$

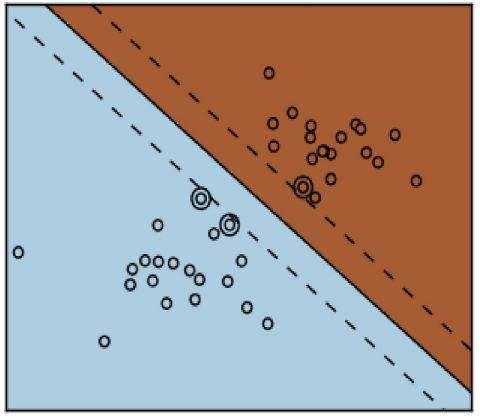
Inseparable case

Let our model mistake, but penalize that mistakes

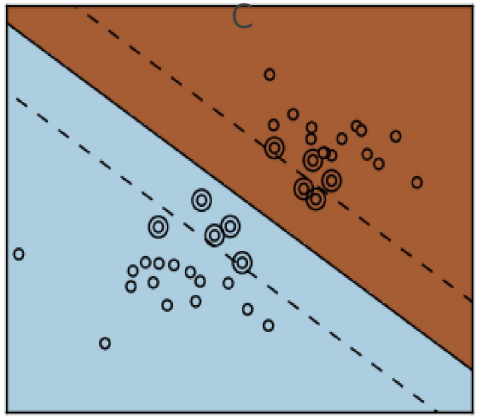
Implemented via margin slack variables

$$\begin{cases} \frac{1}{2}\langle w, w\rangle + C\sum_{i=1}^{\ell}\xi_i \to \min\limits_{w, w_0, \xi}; \\ y_i\big(\langle w, x_i\rangle - w_0\big) \geqslant 1 - \xi_i, \quad i = 1, \ldots, \ell; \\ \xi_i \geqslant 0, \quad i = 1, \ldots, \ell. \end{cases}$$

Big C



Small C



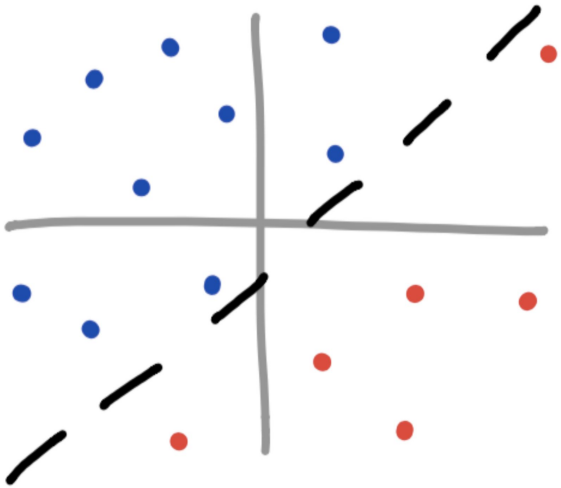
Kernel trick

$$y_i = 1 : w^T x_i - c > 0$$
$$y_i = -1 : w^T x_i - c < 0$$

$$\begin{matrix} x \mapsto \phi(x) \\ w \mapsto \phi(w) \end{matrix} \implies < w, x > \mapsto < \phi(w), \phi(x) >$$

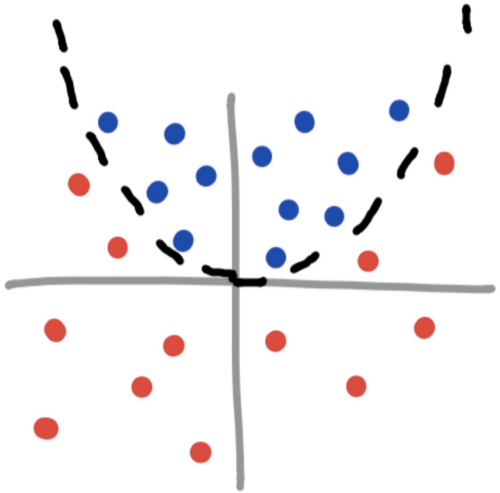
$$K(w, x) =< \phi(w), \phi(x) >$$

Kernel types



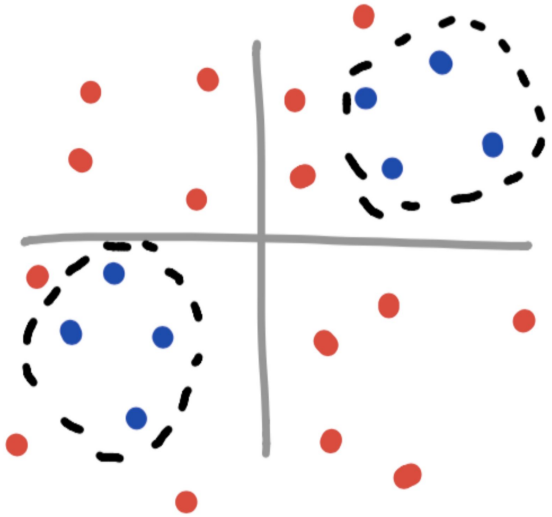
$K(w,x) =< \mathrm{w}, x >$

Linear



$K(w,x) = (\gamma < w,x > +r)^d$

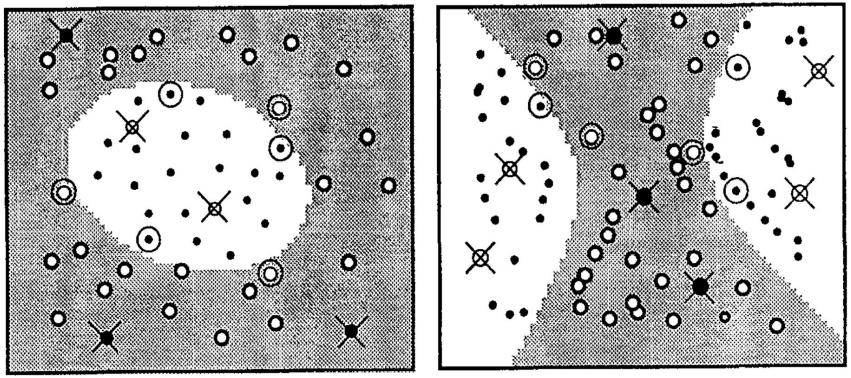
Polynomial



$K(w,x) = e^{-\gamma\|w-x\|^2}$

Gaussian radial basis function

Current state



Principal Component Analysis

girafe ai

02

Principal Component Analysis

$$x_1, \ldots, x_n \rightarrow g_1, \ldots, g_k, k \leq n$$

$$U : UU^T = I, G = XU$$

$$\hat{X} = GU^T \approx X$$

$$||GU^T - X|| \rightarrow \min_{G,U} \; s.t. \; rank(G) \leq k$$

Singular value decomposition

$$||GU^T - X||_2 \leftarrow \min_{G,U} s.t. rank(G) \leq k$$

$$X = V\Sigma U^T : ||GU^T - V\Sigma U^T||_2 = ||G - V\Sigma||_2$$

$$G = V\Sigma' : ||V\Sigma' - V\Sigma||_2 = ||\Sigma' - \Sigma||_2$$

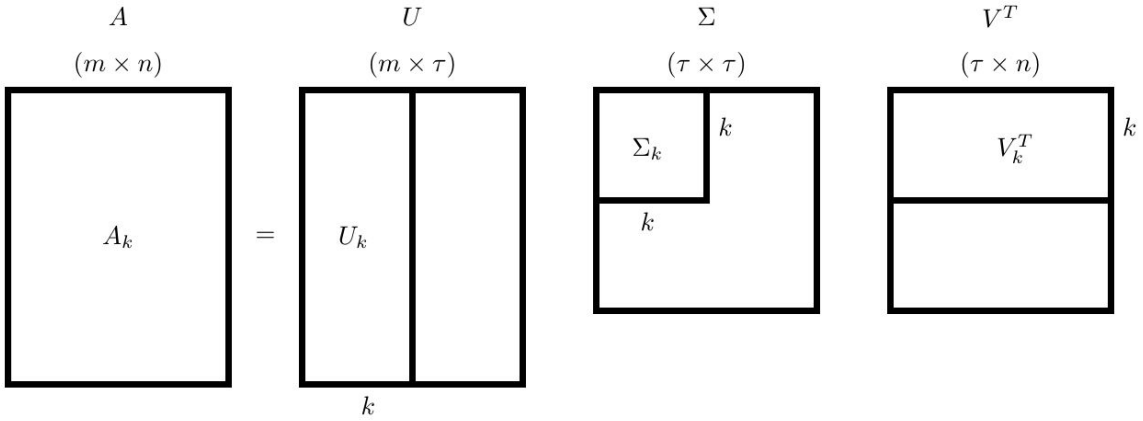
$$||A||_2 = \sigma_{max}(A) : ||\Sigma' - \Sigma||_2 = \sigma_k(\Sigma) = \sigma_k(X)$$

Eckart–Young–Mirsky theorem

Singular value decomposition

$$||GU^T - X|| \to \min_{G,U} \; s.t.\; rank(G) \le k$$

$$X = V\Sigma U^T \qquad \sigma_k(\Sigma) = \sigma_k(X)$$



Eckart–Young–Mirsky theorem

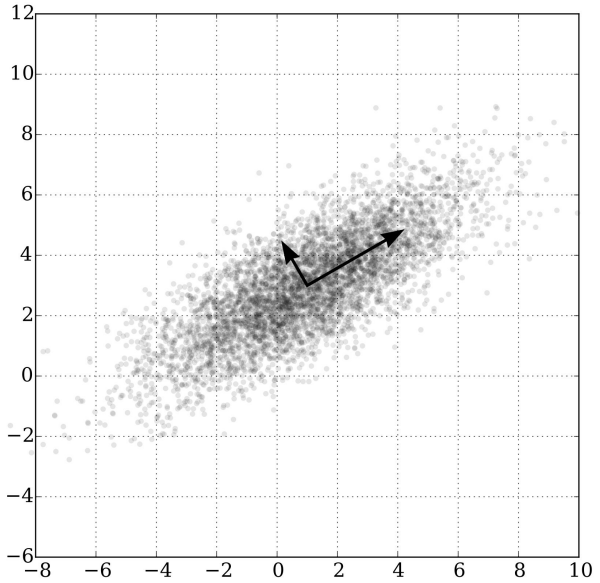
Another approach

Residual variance maximization

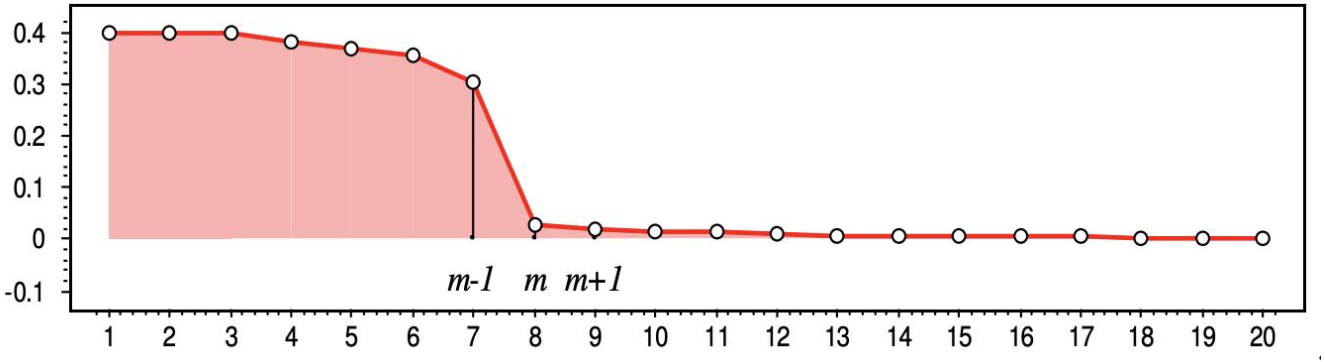
Take new basis vectors greedy

Same result for G and U

Always normalize data before PCA!!!



Dimensionality reduction



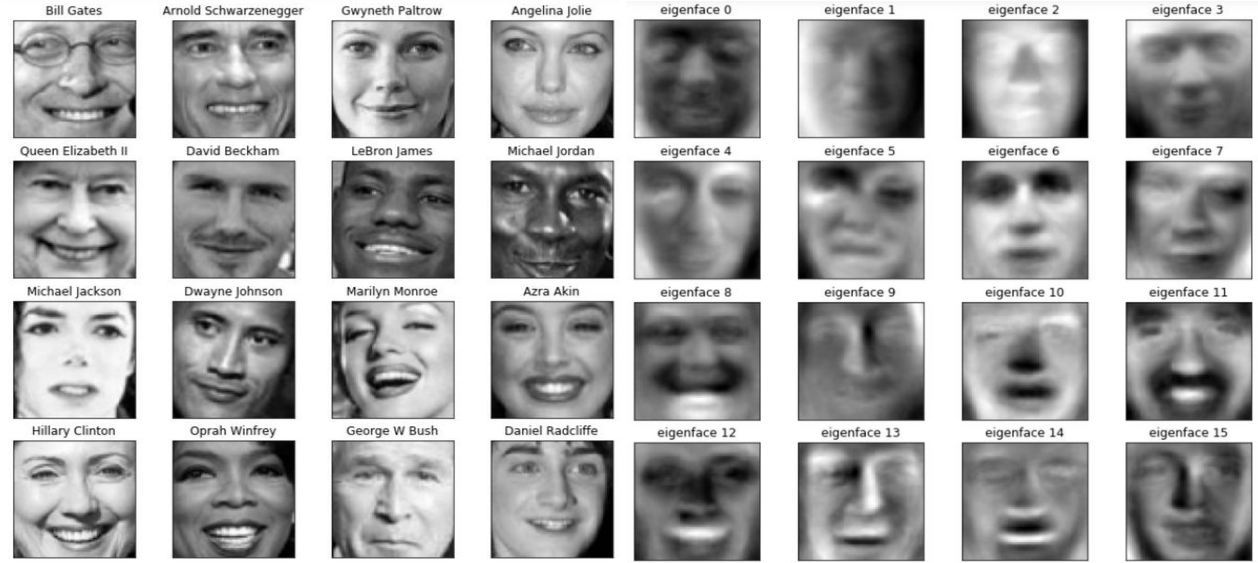
Get rid of low-variance components

$$E_m = \frac{\|GU^\intercal - F\|^2}{\|F\|^2} = \frac{\lambda_{m+1} + \cdots + \lambda_n}{\lambda_1 + \cdots + \lambda_n} \leqslant \varepsilon.$$

Dimensionality reduction

Let’s walk through space…

Dimensionality reduction



16 components

Dimensionality reduction

50 components

Dimensionality reduction

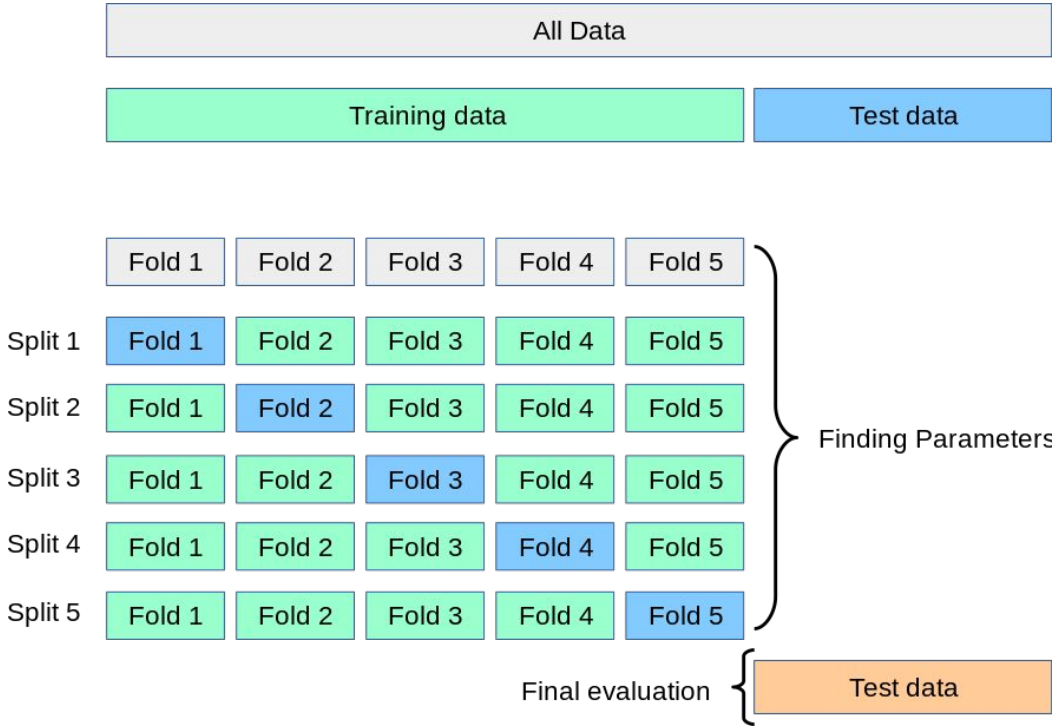
250 components

Validation strategies

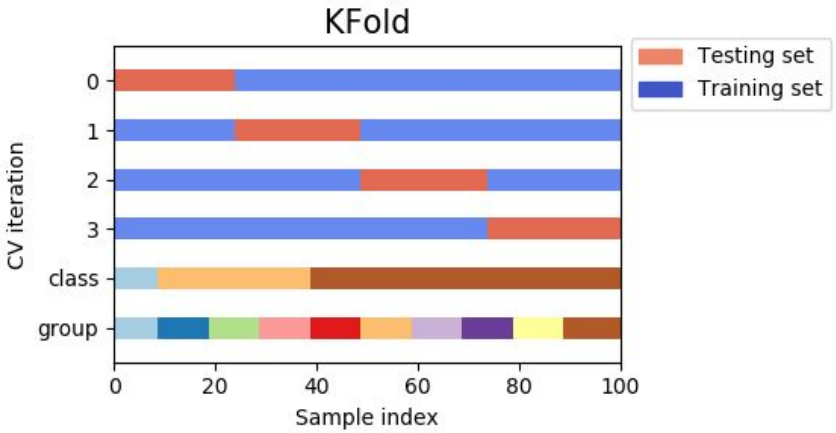
girafe ai

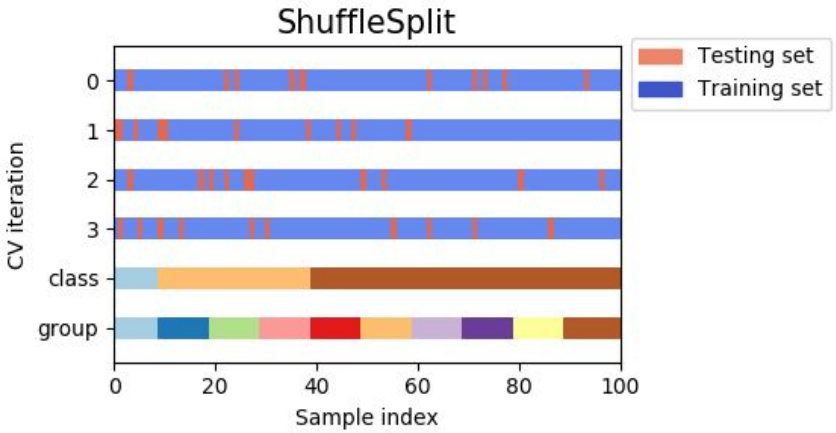
03

Validation strategies



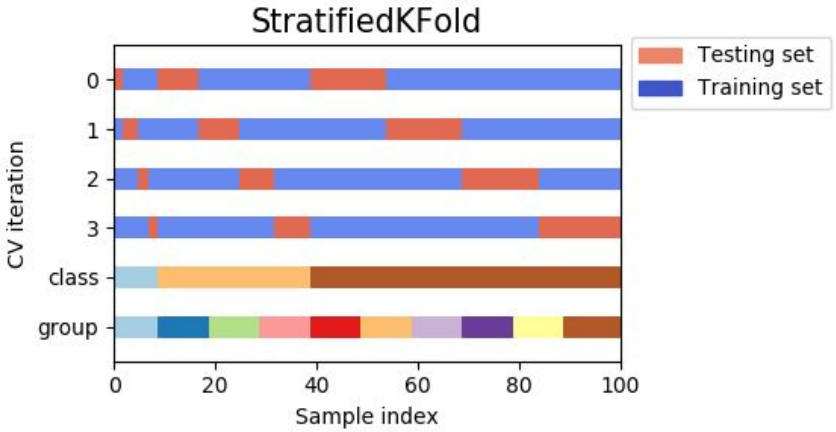
Validation strategies

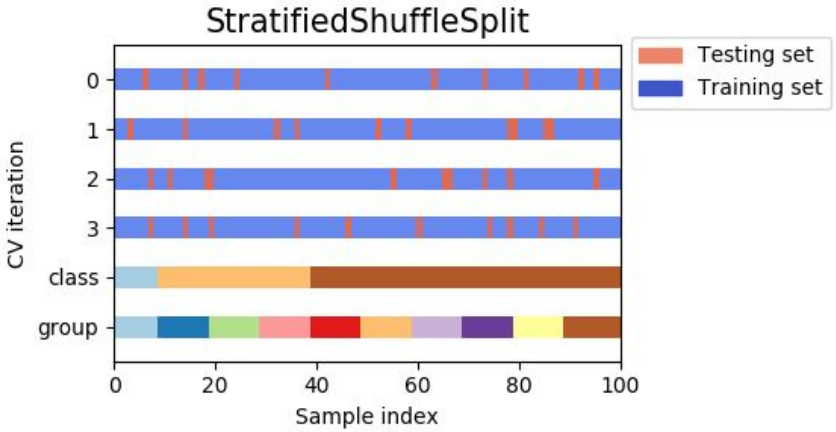




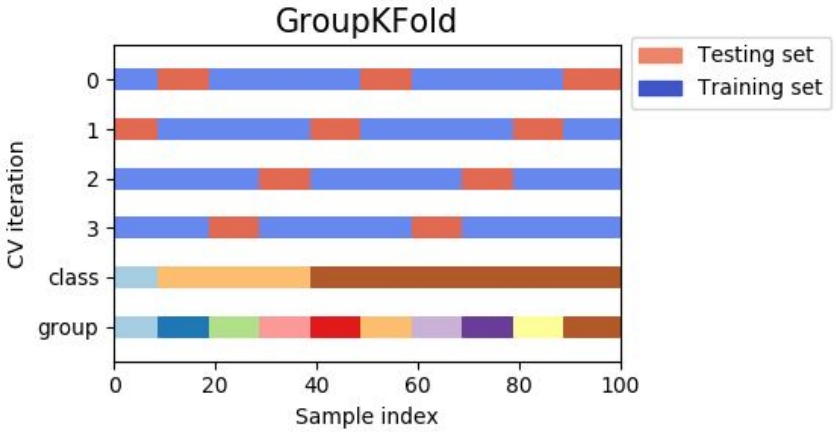
Special case: Leave One Out (LOO) - good for tiny datasets

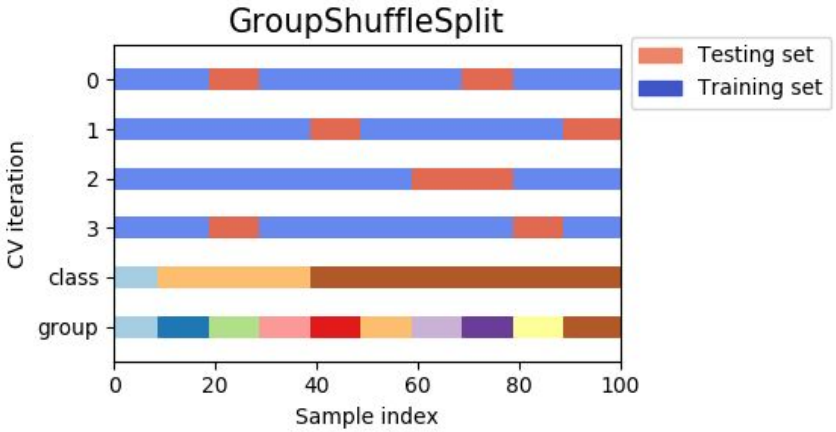
Validation strategies



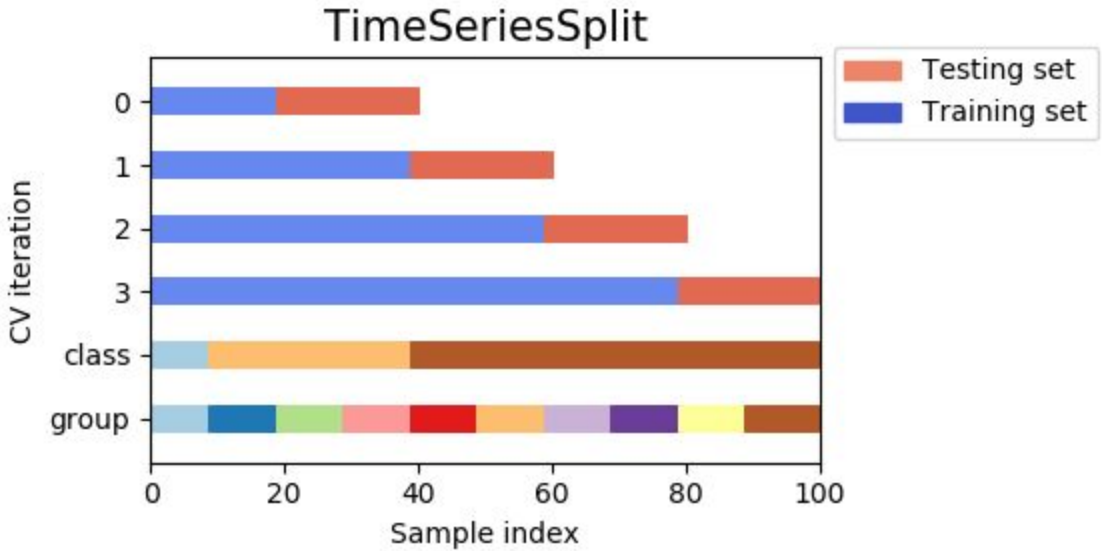


Validation strategies





Special case: time series



Never use train_test_split in this case!!!

Revise

1. Support Vector Machine (SVM)
2. Dimensionality reduction and PCA
3. Validation strategies

Thanks for attention!
